

Task 7

Task Title:

Build a Multi-Agent AI System for Travel Planning

Task Description:

In this task, you will build a multi-agent AI system that helps a user create a travel plan based on their destination, budget, interests, and available time.

Instead of using one LLM, you must create multiple specialized agents. Each agent should have a specific role, and the agents must collaborate step by step to create the final travel plan.

Task Objective:

You must build a system with at least **4 agents**:

- **Destination Agent:**

Analyzes the destination and suggests suitable places and activities.

- **Budget Agent:**

Estimates the expected costs for accommodation, food, transportation, and activities.

- **Itinerary Agent:**

Creates a day-by-day travel schedule based on the collected information.

- **Recommendation Agent:**

Reviews the suggestions and provides the final travel recommendations.

- **(Optional) Evaluator Agent:**

Checks the final plan for consistency with the user's budget, interests, and available time.

Expected Output

The system should generate:

- Recommended Places & Activities
- Estimated Budget
- Day-by-Day Itinerary
- Final Recommendations

The agents must work together, where the output of one agent can be used as input for another agent. The final travel plan should be produced through collaboration between the agents.
