

Task 1

Task Title:

Build a Structured Information Extractor Using an Output Parser

Task Description:

Develop an AI system that extracts structured candidate information from unstructured job application text, resumes, or self-introduction paragraphs.

The system should:

- Accept a paragraph describing a candidate's background, education, and experience.
- Use an LLM to identify and extract relevant information.
- Apply an output parser to enforce a strict JSON schema.
- Validate the generated output before displaying it.
- Return null for any information that is not available in the input text.

Required Output Format:

```
{  
  
Candidate_name:,  
  
Years_of_experience:,  
  
Current_role,  
  
Skills: [],  
  
Highest_Education:  
  
}
```

Requirements:

- The model must return valid JSON only.
- Use an output parser (JSON parser or structured schema parser).
- Missing fields must be returned as null.
- Validate the JSON structure before printing the result.
- Ensure the output strictly follows the defined schema.
